If we are at all unsure, it is better to scrap the part.

I think the point is that an extra 0.005" gap at the support will allow the rocker beam to be misaligned by an additional $14 \times 0.005" = 0.070"$ at the chafing shields, which is NOT insignificant.

David,

RE: D2896-1 Support

Qty(2) supports, the width between attaching faces (3.550-3.560 dim) is 0.005 below tolerance (3.545). When installed in the rocker beam, this means the approx. 0.020 gap (checked with in-tolerance support) is a bit larger. The remaining dims are OK.

I know that you've been very strict with deviations on this aspect of the support in the past. I've scrapped similar supports in the past, but the deviation was much larger (0.015). I am inclined to scrap the parts as the tight tolerance is there for a reason (reduce potential problems with rocker beam alignment and its contact with the crosstube).

Is this deviation acceptable? Can we accept it based on successful assembly and test with the rocker beam?

-Chris
